Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of

the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over JP2001351950 (Toray) in view of US 4,504,571 (Yamamura).

Toray discloses, referring primarily to the abstract submitted in the IDS dated 17 February 2006, a method for forming a circuit board comprising the step of: peeling a flexible film (flexible board B) from a circuit board-use member (reinforcing film D) which comprises the flexible film having a circuit pattern (copper clad) formed on one surface thereof, and a reinforcing plate (reinforcing film D) adhered to the opposite surface of the flexible film to said one surface with a removable organic layer (adhesive layer C [0019]) interposed therebetween, wherein the flexible film is peeled away from the reinforcing plate. Toray does not specifically disclose that a peel angle is being maintained in the range of more than 0° to 80° [claim 4]. However, Yamamura teaches peeling away a flexible film from a support using a peel angle in the claimed range (see abstract). Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention to use a peel angle in the range of more than 0° to 80° in the invention of Toray as is known in the art and evidenced by Yamamura. The motivation

Art Unit: 2841

for doing so would have been to achieve the predictable result of easy separation (Yamamura abstract).

Allowable Subject Matter

Claims 5-10, 12, and 13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
